Recommended Tunes

Your Music. Your Taste. Discovered.

Team: Jonathan Hill · Jacob Solano · Semir Ali · Richard Selznick

CodePath WEB103 · Final Project

The Problem

You love music. Keeping track of it is a mess.

- Playlists get cluttered and disorganized
- No easy way to log your favorite artists, songs, and genres in one place
- Existing apps don't let you build a fully custom favorites list the way *you* want it

Our Solution

A personal music favorites manager — built by you, for you.

- Add your favorite **songs**, **artists**, and **genres** to one place
- **Edit or remove** entries any time
- The app analyzes your taste to surface music you might love next

Key Features

Feature	What it does
Add Song / Artist / Genre	Build your personalized favorites list
Edit Entries	Correct mistakes or update details
Delete Entries	Keep your list clean and current
User Accounts	Each user has their own private favorites
Admin Controls	Admins can manage accounts to keep the platform healthy

Technical Design

Full-stack web app with a RESTful API

Frontend: React + React Router

Backend: Node.js / Express

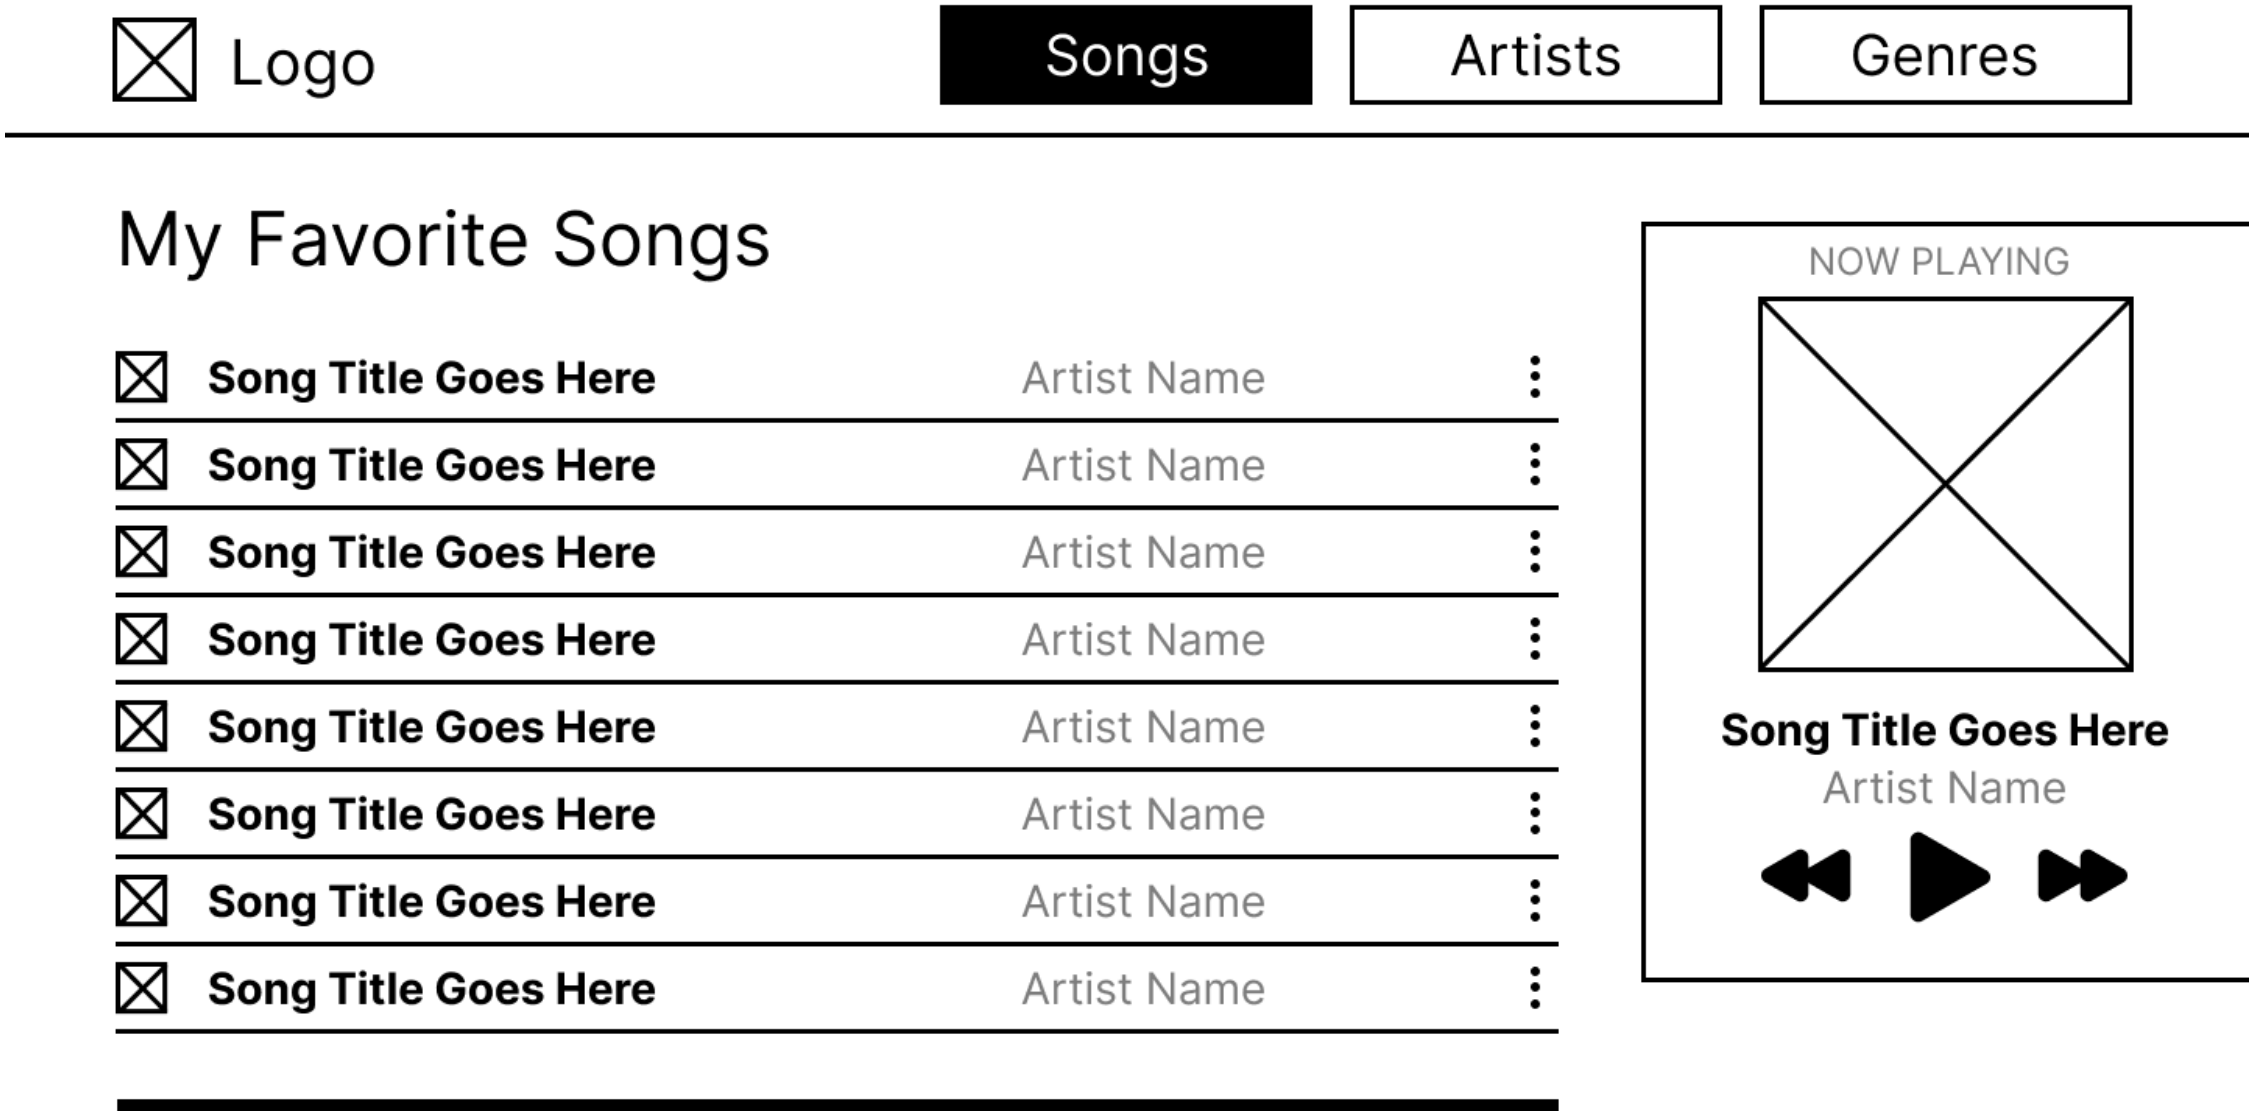
Database: PostgreSQL

API Routes: GET · POST · PATCH · DELETE for songs, artists, and genres

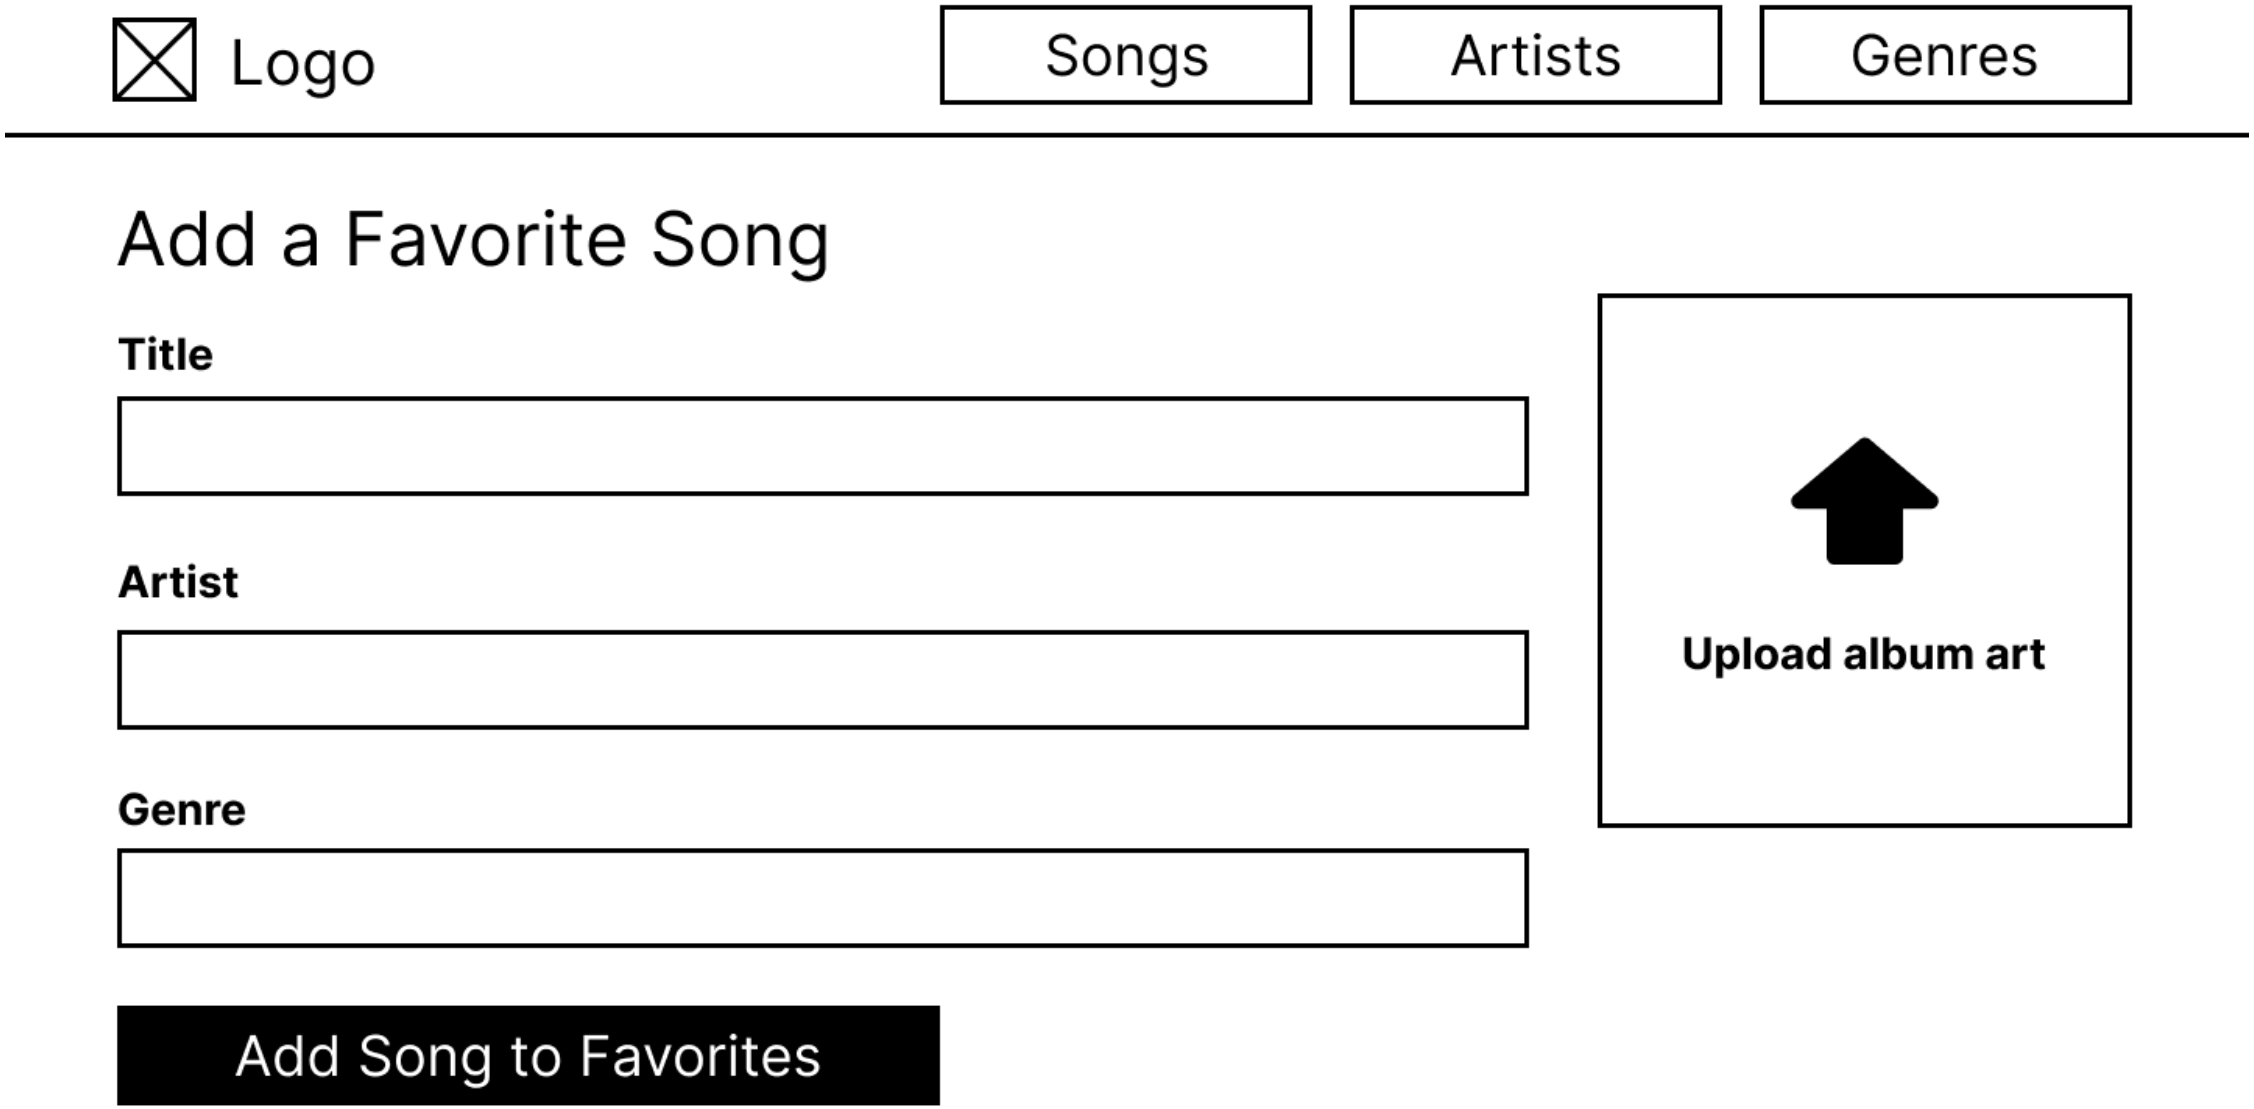
Key relationships:

- A user owns many songs, artists, and genres
- An artist has many songs
- Songs can belong to many genres *(many-to-many)*

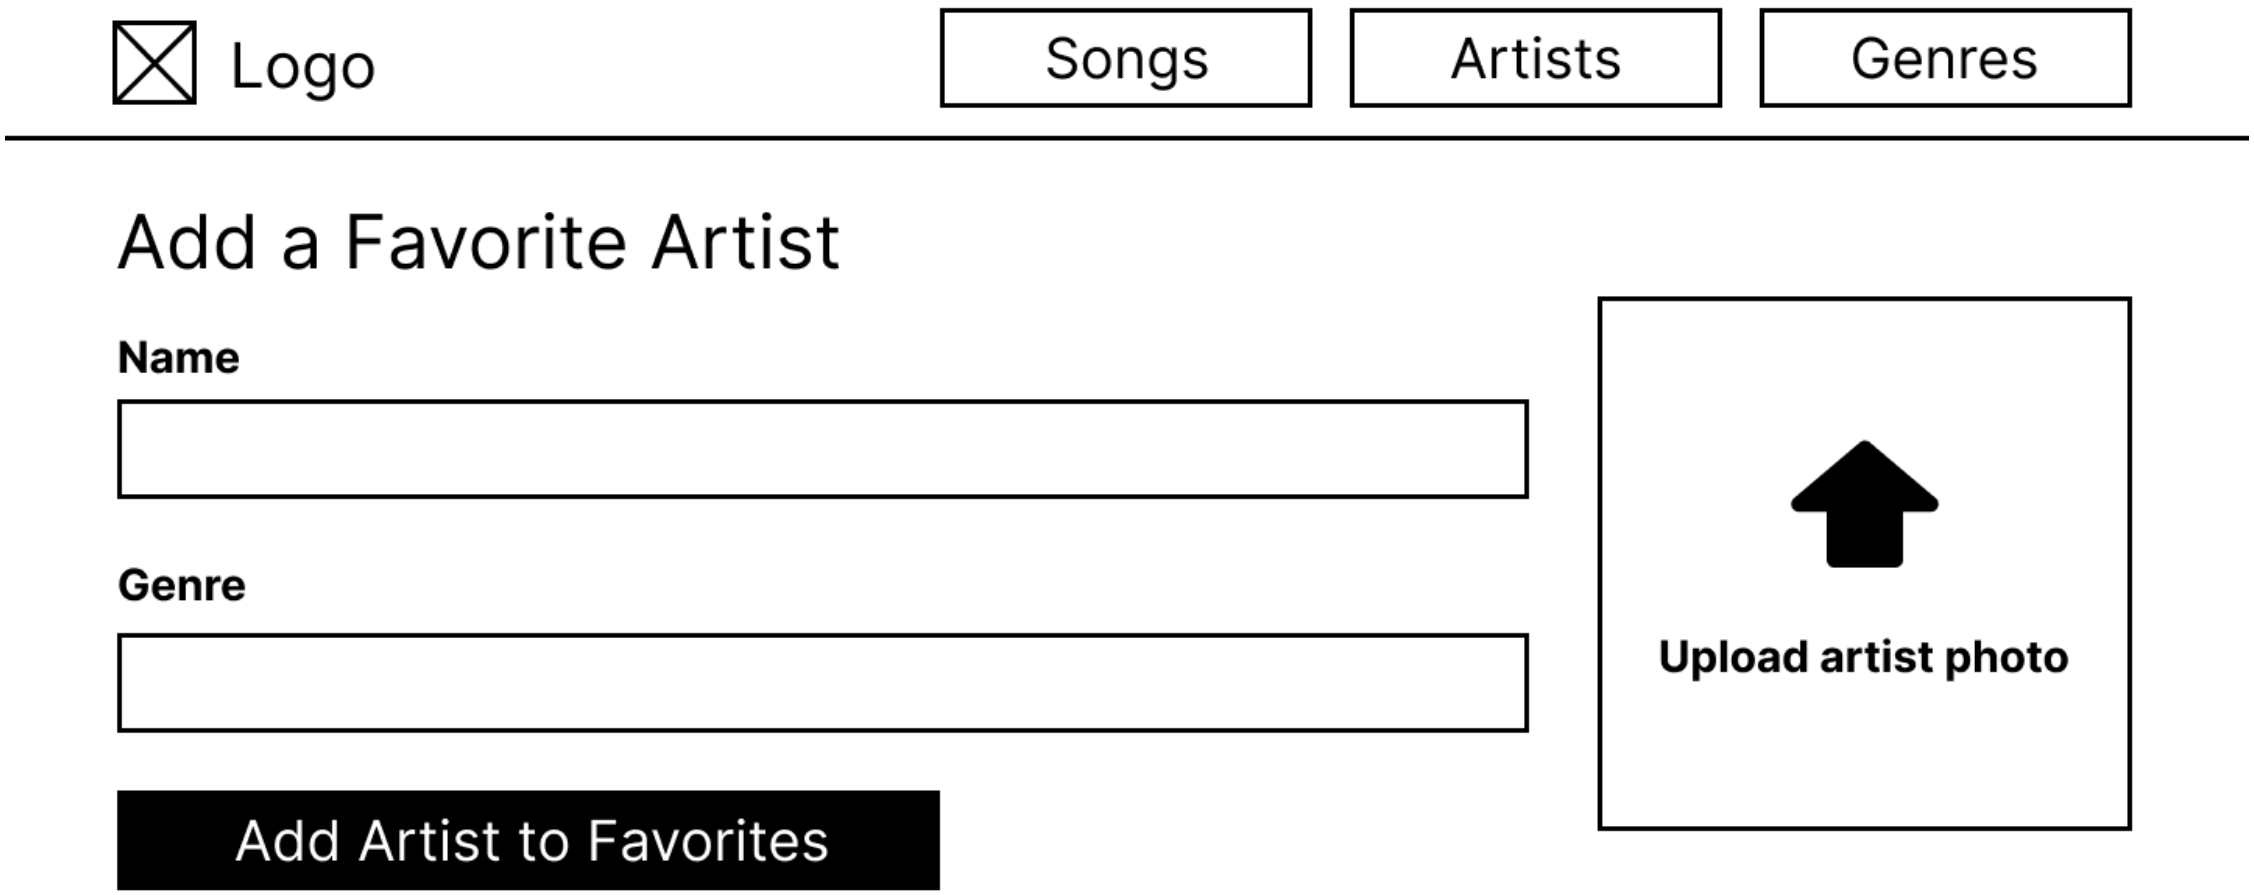
Wireframe — Favorite Songs



Wireframe — Add a Song



Wireframe — Add an Artist



Roadmap & What's Next

Where we are:

- ✅ Planning complete (user stories, wireframes, ERD)

Coming next:

- Build the Express API (routes for songs, artists, genres)
- Stand up the PostgreSQL database with relationships
- Build React frontend with React Router navigation
- Connect frontend to backend and deploy on Render

Our goal: A fully deployed, working app by the end of the course.
